

PROJECT PROPOSAL

Team XNote

2019 年 3 月 16 日

1 XNote Overview

XNote is a cross-platform desktop application we propose to facilitate the learning process through note taking and mind maps, especially for students. XNote will support Markdown, a lightweight markup language with plain text formatting syntax, to relieve learners of the trouble of typesetting. It will also generate a dynamic mind map to show interconnections within and across different notes. These two features are what is lacking in the other existing note-taking Apps.

2 Features

Detailed features of XNote are listed as follows:

1. Support both markdown and ordinary text format.
2. A note management system, including but not limited to key word search, time-based learning record, tagging, cloud synchronization.
3. Generate mind maps automatically.
4. Output html and pdf files.
5. Personalized user interface style.
6. Support multiple platforms, including Windows, Linux, macOS.

3 Technical Analysis

We plan to use the Electron framework to develop XNote. It uses Node.js runtime for the backend and Chromium for the frontend so it enables us to use web technologies, like JavaScript, CSS and HTML to build desktop Apps. We may use the open source code from markdown official to do the markdown support part of our App. And since it is written in JavaScript so we would like to use this language for the backend of our project. For the UI, we will mainly use CSS and HTML. It will contain A text editor, a typeset view, a mind map view and a timeline to record the use. We believe a simple style is appropriate while also give the users options to create their own style.
